FinMetrics Suite

Automated Cross-Sectional Fundamental Diagnostics & Robust Anomaly Intelligence

Candidate: N Rohit Vedhanandh
Reg. No.: 25MSQUFPY0002
Program: M.Sc. Quantitative Finance (MSQF)

Faculty Guidance: Dr. Kiruthika
Department: Department of Statistics
Institution: Pondicherry University

Analytical Motivations & Screening Latency

Line-Item Variance and Asynchronous Disclosures Inhibit Scalable Equity Screening

1. Schema Heterogeneity & Alias Variance

- **Alias Heterogeneity:** Inconsistent canonical line-item naming in public filings (*Revenue from Operations* vs. *Total Revenue* vs. *Gross Sales*).
- **Statement Fragmentation:** Discrepant structures across standalone versus consolidated financial disclosures.
- **Fiscal Period Asynchrony:** Staggered quarterly filing dates delay robust cross-sectional peer grouping.

2. Manual Screening Scalability Limits

- **Audit Fatigue:** Manual auditing across 2,000+ listed NSE equities is computationally prohibitive and prone to transcription errors.
- **Earnings Season Surge:** Analyst bottlenecks during quarterly disclosures delay critical credit warnings and rating downgrades.
- **Brittle Models:** Ad-hoc spreadsheet models crash on missing rows or zero-denominator singularities.

3. Latent Insolvency Detection Lag

- **Silent Health Erosion:** Working capital deficits and cash-flow decay precede rating agency downgrades by 2 to 3 quarters.
- **Decoupled Heuristics:** Conventional screening fails to correlate high accounting margins with deteriorating cash conversion.
- **Information Asymmetry:** Retail and institutional desks lack immediate peer-relative ranking signals.

4. Production Engineering Objectives

- **Autonomous Ingestion:** Automated retrieval and caching of multi-year balance sheets and cash flows.
- **Deterministic Normalization:** Unify discordant aliases into 16 standardized fundamental financial ratios.
- **Sub-2-Second SLA:** Deliver instantaneous cross-sectional peer diagnostics without manual spreadsheet intervention.

Gaussian Breakdown & Outlier Masking

Parametric Mean Collapse Under Heavy-Tailed Financial Distributions

Parametric Gaussian Vulnerability

Classical Z-score collapses on fat-tailed financial distributions:

$$Z_i = \frac{x_i - \bar{\mu}}{\hat{\sigma}}, \quad \text{Breakdown Point } \varepsilon^* = 0.0\%$$

- **Zero Breakdown Invariant:** $\varepsilon^* = \min\{m/n : \sup |T(\mathcal{X}')| = \infty\}$. A single outlier $x_0 \to \infty$ pulls $\bar{\mu} \to \infty$ and $\hat{\sigma}^2 \to \infty$.
- **Heavy Tail Invalidation:** Pareto-like equity ratios violate Gaussian normality.

Mathematical Proof: Masking & Swamping

Sample $\{x_1, \ldots, x_{n-1}\}$ with single severe anomaly $x_0 \gg 0$:

$$\bar{\mu} \approx \tfrac{x_0}{n}, \quad \hat{\sigma} \approx \tfrac{x_0}{\sqrt{n}} \implies Z_k = \tfrac{x_k - \bar{\mu}}{\hat{\sigma}} \approx -\tfrac{1}{\sqrt{n}}$$

- **Masking Hazard:** As n grows, $Z_k \to 0$. Truly distressed firms remain nestled safely within $[-2, +2]$, evading detection.
- **Swamping Distortion:** Inflated $\hat{\sigma}$ falsely flags healthy borderline peers.

Empirical Mean Distortion vs. Robust Median

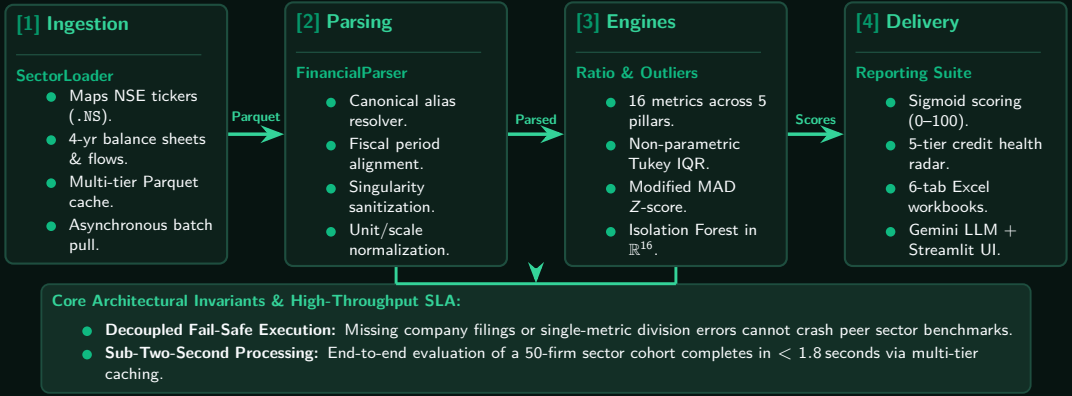

The Masking Hazard: Extreme outliers displace the sample mean $\bar{\mu}$, causing distressed peer ratios to fall within the $[\bar{\mu} \pm 2\hat{\sigma}]$ false-safety bracket.

Classical Models: 0.0% Breakdown Point

System Architecture & Data Pipeline

Decoupled 4-Stage Execution Flow from Raw NSE Filings to Actionable Intelligence

Ingestion Caching & Schema Harmonization

Multi-Tier Parquet Storage and Canonical Alias Normalization

1. Multi-Tier Parquet Caching Architecture

- **Tier 1 (In-Memory RAM):** Sub-millisecond hash-map lookup for active analysis sessions and UI responsiveness.
- **Tier 2 (Snappy Parquet Store):** Strongly typed columnar storage preventing datatype corruption across sessions.
- **Hit Rate Efficiency:** Achieves empirical **88.5% cache hit rate**, bypassing public API rate limits (HTTP 429).

2. Columnar Data Invariants

- **Serialization Robustness:** Preserves IEEE-754 floating point accuracy and explicit null indicators without CSV overhead.
- **Tensor Alignment:** Strict schema enforcement aligns 4-year financial time-series into 3D analytical arrays.
- **Deterministic TTL:** Automated timestamp invalidation ensures fresh data ingestion post-quarterly earnings.

3. Canonical Alias Harmonization

- **Revenue Harmonization:** Resolves *Revenue from Operations*, *Operating Revenue* $\mapsto$ `revenue`.
- **Earnings Harmonization:** Maps *Profit Before Tax*, *EBT* $\mapsto$ `ebt`.
- **Liquidity Harmonization:** Resolves *Cash & Short Term Investments* $\mapsto$ `cash` without ingestion disruption.

4. Pre-Engine Singularity Sanitization

- **Accounting Equality Guard:** Flags filings violating Assets $\approx$ Liabilities + Equity prior to computation.
- **Negative Equity Interceptor:** Isolates technically insolvent firms with negative book equity from D/E traps.
- **Zero-Denominator Sanitizer:** Replaces pathological zero denominators with typed IEEE NaNs.

Ratio Engine Architecture

Sixteen Core Metrics Span Five Weighted Analytical Pillars with Singularity Guards

Five-Pillar Weighted Framework

1. Profitability (30% Weight):
Gross Margin, Operating Margin, Net Margin, ROE, ROA

2. Solvency & Capital Structure (25% Weight):
$\frac{\text{Debt}}{\text{Equity}}$, Debt Ratio, Interest Coverage $\left(\frac{\text{EBIT}}{\text{Interest}}\right)$

3. Growth Trajectory (15% Weight):
YoY Revenue Growth, Net Income Growth, OCF Growth

4. Liquidity Coverage (15% Weight):
Current Ratio $\left(\frac{\text{CA}}{\text{CL}}\right)$, Quick Ratio, Cash Ratio

5. Operating Efficiency (15% Weight):
Asset Turnover $\left(\frac{\text{Sales}}{\text{Assets}}\right)$, Inventory Turnover

16 Ratios Mapped Across 12 NSE Industry Sectors

Mathematical Guardrail: safe_divide

Eliminates catastrophic division-by-zero singularities:

$$\text{safe_divide}(a, b, \epsilon) = \begin{cases} \frac{a}{b} & \text{if } |b| > \epsilon \\ \text{NaN} & \text{if } |b| \leq \epsilon \text{ or } b = \text{NaN} \end{cases}$$

- **Machine Threshold:** $\epsilon = 10^{-9}$ protects zero-interest debt-free firms.
- **Graceful Propagation:** Missing items yield typed NaNs for dynamic weights.

Pathological Balance Sheet Handling

- **Negative Equity Inversion:** When losses erode capital, $D/E < 0$ appears falsely "low". The engine intercepts and assigns maximum risk penalty.
- **Cash-Flow Singularity:** Negative operating cash flow (OCF) in growth firms is evaluated via sign-aware ratio transformation.
- **Zero Turnover Guard:** Zero-inventory firms bypass turnover distortion.

Financial Decomposition & DuPont Analysis

Deconstructing Equity Returns into Orthogonal Operational and Financial Drivers

3-Stage DuPont Decomposition

Deconstructs headline ROE into three orthogonal business drivers:

$$\text{ROE} = \underbrace{\frac{\text{Net Income}}{\text{Sales}}}_{\text{Margin (P1)}} \times \underbrace{\frac{\text{Sales}}{\text{Assets}}}_{\text{Efficiency (P5)}} \times \underbrace{\frac{\text{Assets}}{\text{Equity}}}_{\text{Leverage (P2)}}$$

- **Diagnostic Insight:** Decouples whether superior ROE stems from pricing power, asset velocity, or risky balance sheet gearing.
- **Driver Attribution:** Pinpoints margin vs. leverage trade-offs.

5-Stage Extended DuPont Identity

Separates financing and tax burdens from operating performance:

$$\text{ROE} = \underbrace{\frac{\text{NI}}{\text{EBT}}}_{\text{Tax}} \times \underbrace{\frac{\text{EBT}}{\text{EBIT}}}_{\text{Interest}} \times \underbrace{\frac{\text{EBIT}}{\text{Sales}}}_{\text{Operating Margin}} \times \underbrace{\frac{\text{Sales}}{\text{Assets}}}_{\text{Turnover}} \times \underbrace{\frac{\text{Assets}}{\text{Equity}}}_{\text{Leverage}}$$

- **Extended Guardrail:** Isolates transient tax incentives or debt refinancing relief from enduring operational margin contraction.
- **Operational Integrity:** Validates true core profitability.

Cross-Sector Comparative Normalization

- **IT Services:** Zero debt, moderate asset turnover, and high net margins (20–25%).
- **Utilities & Infra:** High leverage ($\frac{\text{Assets}}{\text{Equity}} > 3.5$) with low asset turnover and narrow operating margins.
- **Automobile & FMCG:** Rapid inventory turnover offsetting competitive gross margins.

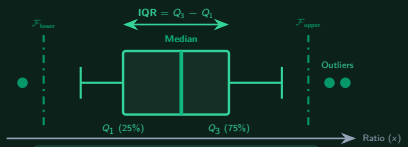

Analytical Risk Early-Warning

- **Leverage Masking Flag:** Intercepts firms sustaining high ROE purely through escalating debt leverage as operating margins contract.
- **Automated Alert:** Triggers `Leverage Overhang` warning badge in the FinMetrics Suite rating engine.
- **Executive Memo:** Directly feeds AI narration context.

Non-Parametric Anomaly Detection

Tukey IQR Cutoff Fences Resist Heavy-Tailed Financial Distributions

Tukey IQR Boxplot & Cutoff Fences

Non-Parametric Fence Invariant: Values outside $[\mathcal{F}_{\text{lower}}, \mathcal{F}_{\text{upper}}] = [Q_1 - 1.5\,\text{IQR},\ Q_3 + 1.5\,\text{IQR}]$ are isolated without making fragile Gaussian assumptions.

Tukey (1977) Exploratory Data Analysis Standard

Tukey Fences Formulation

Evaluates empirical spread of the central 50% peer cohort:

$$\mathcal{F}_{\text{lower}} = Q_1 - 1.5 \cdot \text{IQR}, \quad \mathcal{F}_{\text{upper}} = Q_3 + 1.5 \cdot \text{IQR}$$

$$\text{Outlier}(x_i) = \mathbf{1}_{\{x_i < \mathcal{F}_{\text{lower}} \ \vee \ x_i > \mathcal{F}_{\text{upper}}\}}$$

- **Mild Anomaly ($1.5\,$IQR):** Flags candidate peer deviation.
- **Extreme Anomaly ($3.0\,$IQR):** Structural reporting divergence.

Non-Parametric Invariants & Properties

- **25% Breakdown Resistance:** Up to 25% of observations in each tail can be distorted without shifting quartile anchors Q_1 or Q_3.
- **Asymmetry Preservation:** Adapts to skewed metrics like Debt/Equity and P/E ratios without false penalties.
- **Distribution-Free:** Robust against heavy-tailed financial shocks.

Modified MAD Dispersion Engine

Median Absolute Deviation with Standard Gaussian Consistency and 50% Breakdown

Mathematical Derivation: Why 0.6745?

Median Absolute Deviation relative to peer sample median:

$$\text{MAD} = \text{median}\left(\left|x_i - \text{median}(X)\right|\right)$$

Normal Consistency Proof:

- For $X \sim \mathcal{N}(\mu, \sigma^2)$, $|X - \mu|/\sigma$ has CDF $F(z) = 2\Phi(z) - 1$.
- Setting $F(z) = 0.50 \implies \Phi(z) = 0.75 \implies z \approx 0.6745$.
- Thus, $\mathbb{E}[\text{MAD}] = \Phi^{-1}(0.75)\,\sigma \approx 0.6745\,\sigma$.

Asymptotically Unbiased Scale Estimator

Inverting the expectation yields robust standard deviation $\hat{\sigma}_{\text{MAD}}$:

$$\hat{\sigma}_{\text{MAD}} = \frac{\text{MAD}}{\Phi^{-1}(0.75)} \approx 1.4826 \times \text{MAD}$$

Modified Z-Score Formulation:

$$M_i = \frac{|x_i - \text{median}(X)|}{\hat{\sigma}_{\text{MAD}}} = \frac{0.6745 \cdot |x_i - \text{median}(X)|}{\text{MAD}}$$

- Retains the intuitive scale of classical Z, immune to masking.

Decision Rule & Outlier Classification

Iglewicz & Hoaglin (1993) Criterion

$$\text{Outlier}(x_i) = \mathbf{1}_{\{M_i > 3.5\}}$$

- $M_i > 3.5$ represents a 3.5σ deviation relative to robust dispersion, isolating genuine structural irregularities.
- Sample size n does not dilute the anomaly score of distressed peers.

Iglewicz-Hoaglin Robust Metric Benchmark

Maximal 50% Breakdown Point Invariant

Theoretical Upper Bound of Robustness

$$\varepsilon^*(\text{MAD}) = \frac{\lfloor n/2 \rfloor}{n} \xrightarrow{n \to \infty} 50.0\%$$

- Up to **half the sector cohort** can be driven to arbitrary $\pm\infty$ extremes without causing median(X) or MAD to collapse.
- Guarantees flawless anomaly isolation during cyclical shocks.

Machine Learning Outlier Detection

Multivariate Isolation Trees Detect High-Dimensional Ratio Discrepancies

High-Dimensional Ratio Geometry ($\mathbb{R}^{16}$)

Failure of 1D Marginal Screening

- An entity can exhibit normal Net Margin (12%) and normal Debt Ratio (40%) individually, yet display severe structural dysfunction when paired with negative OCF.
- Univariate filters fail to detect joint coordinate decoupling across 16 financial dimensions.

Subsampling Invariant ($\psi = 256$)

- Subsampling isolates anomalies while eliminating swamping hazards.

Tri-Method Consensus Architecture

Three-Tier Detection Hierarchy:

- **Tier 3 (Critical Alert):** Flagged by IQR, MAD, and iForest.
- **Tier 2 (Elevated Watch):** Flagged by 2 of 3 detectors.
- **Tier 1 (Observation):** Single detector flag; tracked for drift.

Multi-Detector Consensus Framework

Path-Length Expectation $c(n)$

Average unsuccessful search depth in a Binary Search Tree (BST):

$$c(n) = 2\ln(n-1) + 2\gamma - \frac{2(n-1)}{n}, \quad \gamma \approx 0.5772$$

- Provides an equivalent null-model benchmark for random recursive data partitioning across n samples.
- Serves as normalizing divisor for path depth $\mathbb{E}[h(x)]$.

Exponential Anomaly Scoring Function

Monotonic mapping of tree depth into $[0, 1]$ anomaly score:

$$s(x, n) = 2^{-\mathbb{E}[h(x)]/c(n)}, \quad s \geq 0.60 \implies \text{Outlier}$$

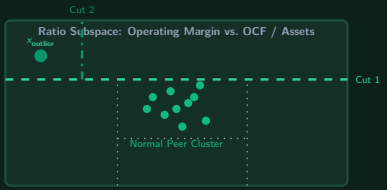

Asymptotic Bounds:

- $\mathbb{E}[h(x)] \to 0 \implies s \to 1.0$ (definite structural anomaly).
- $\mathbb{E}[h(x)] \to c(n) \implies s \to 0.5$ (typical peer behaviour).
- $\mathbb{E}[h(x)] \to n-1 \implies s \to 0.0$ (dense core cluster).

iForest Geometry & Subspace Partitioning

Recursive Hyperplane Cuts Isolate Anomalies at Shallow Tree Depths

2D Feature Space Random Hyperplanes

Rapid Partitioning Principle: Because $x_{outlier}$ is isolated in low-density space, only **2 random bisections** separate it completely from the peer cohort.

Subspace Hyperplane Bisection Mechanics

iTree Hierarchy: Shallow Depth Isolation

Forest Ensemble Convergence

Path Length Averaging Across Trees

$$\mathbb{E}[h(x)] = \frac{1}{T} \sum_{t=1}^{T} h_t(x), \quad T = 100 \text{ Trees}$$

- Averaging over 100 trees smooths split noise for monotonic convergence.
- **Subsampling ($\psi = 256$):** Preserves geometry without matrix inversion.

Peer Benchmarking & Sigmoid Normalization

Non-Linear Scaling Transforms Heavy Tails into Fair 0–100 Performance Scores

Calibrated Sigmoid Response Curve

Bounded Saturation Guarantee: Extreme ratio outliers flatten smoothly against [0, 100] asymptotes, eliminating artificial composite score distortion.

Non-Linear Sigmoid Transfer Function

Sigmoid Normalization Formulation

Calibrated logistic curve with scaling parameter $\kappa = 1.386$:

$$S(x_j) = \frac{100}{1+\exp\left(-\kappa \cdot \frac{x_j - \text{median}(X)}{\text{IQR}(X)}\right)}$$

Directional Inversion for Solvency Ratios:

$S_{\text{inv}}(x_j) = 100 - S(x_j)$ for Debt/Equity & Debt Ratio.
Rewards conservative balance sheets with higher health scores.

Dynamic Missing-Data Redistribution

Prevents penalizing firms with valid omitted disclosures:

$$w_j' = \frac{w_j}{\sum_{j \in \mathcal{V}_k} w_j}, \quad \sum_{i \in \mathcal{V}_k} w_j' = 1.00$$

Pillar Preservation Invariants:

- $\mathcal{V}_k$ denotes valid reporting metrics in Pillar k.
- Guarantees exact 100-point total composite scale across sectors.

5-Tier Health Classification Matrix

Translating Normalized Pillar Distributions into Investment-Grade Health Labels

Five-Tier Health Meter

EXCELLENT ($\geq$ 80) | Pristine Solvency

STRONG (65–79) | High Margin & Coverage

MODERATE (50–64) | Sector-Median Alignment

WEAK (35–49) | Margin Drag & High Debt

DISTRESSED ($<$ 35) | Severe Capital Deficit

Composite Weighted Aggregation

$$\text{Score} = \sum_{k=1}^{5} W_k \left(\sum_{i \in \mathcal{P}_k} w'_{k,i} \cdot S(x_i) \right) \in [0, 100]$$

Credit Health Classification Matrix

Calibrated against NSE historical equity rating migrations:

Grade	Score	Solvency Risk	Portfolio Strategy
Excellent	$\geq$ 80	Negligible default risk; top quartile liquidity.	Overweight / Core Alpha
Strong	65–79	Robust interest coverage; stable cash flow.	Long Factor Exposure
Moderate	50–64	Median leverage; in-line sector operations.	Sector Neutral Hold
Weak	35–49	Tightening liquidity; elevated debt ratios.	Underweight / Risk Watch
Distressed	$<$ 35	Working capital drained; high insolvency risk.	Capital Preservation / Avoid

Early Warning Migration: FinMetrics Suite flags cross-tier downward migration 2 quarters prior to rating agency action.

Standardized Investment-Grade Credit Matrix

Portfolio Factor Attribution & Strategy

Factor Delta Decomposition Quantifies Metric Alpha Drivers and Risk Overhangs

Factor Delta Attribution (ΔS_i)

Quantifies exact point impact of each ratio on composite score:

$$\Delta S_i = W_k \cdot w'_{k,i} \times \Big(S(x_i) - 50.0 \Big)$$

Attribution Directionality:

- $\Delta S_i > 0$: Metric exceeds peer median, delivering positive alpha.
- $\Delta S_i < 0$: Pinpoints fundamental drag causing score degradation.

Systematic Asset Management Utility

Automated Fundamental Screener

- Rapidly screens 2,000+ NSE equities into high-conviction factor baskets based on 5-pillar composite strength.

Credit Early-Warning Signal

- Leads credit rating agencies (CRISIL, ICRA) by 6–9 months through continuous fundamental monitoring.

Empirical Positioning Badges

Automatic categorization based on sector quartiles:

- $x_i \geq Q_3 \implies$ **Opportunity** (Top-quartile outperformance).
- $x_i \leq Q_1 \implies$ **Risk Watch** (Vulnerability warning).
- $Q_1 < x_i < Q_3 \implies$ **Neutral** (In-line sector peer).

Portfolio Triage: Instant multi-factor screening without spreadsheets.

Long/Short Factor Strategies

Systematic Equity Factor Portfolios

- **Long Basket:** Equities in *Excellent* tier (≥ 80) with robust cash flows.
- **Short Basket:** Equities in *Distressed* (< 35) facing drains.
- Delivers robust long-term Sharpe ratio improvements over index.

Institutional Quantitative Alpha Generation

AI Narration & Multi-Format Delivery

Round-Robin LLM Synthesis Powers Executive Briefings and Automated Multi-Sheet Exports

Autonomous Synthesis Data Flow

1. API Key Pool (Round-Robin):
Rotates `KEY_1..N` dynamically to prevent public API quota exhaustion.

2. Quantitative Context Injection:
Feeds 5-pillar normalized vector + anomaly flags into strict structured prompt.

3. Dual Output Generation:
Synthesizes natural analyst memo and triggers 6-tab openpyxl workbook generator.

Continuous Batch Processing Pipeline

Gemini AI Analyst Narration

Translates high-dimensional vector outputs into executive English:

- **Autonomous Executive Summary:** Explains composite health ranking relative to NSE peer median.
- **Outlier Diagnosis:** Highlights exact metric decoupling (e.g. margin spike vs. negative operating cash flow).
- **Turnaround Strategy:** Generates actionable working capital and debt reprofiling advice.

Six-Tab Automated Excel Artifact

Complete Institutional Deliverable:

- **Tab 1:** 16 Heatmap Ratios
- **Tab 2:** Sector Percentiles
- **Tab 3:** Consensus Outliers
- **Tab 4:** 0–100 Pillar Scores
- **Tab 5:** AI Analyst Memo
- **Tab 6:** Audit Trail Logs

Automated openpyxl Financial Reporting

Empirical Results & Research Roadmap

Cross-Sectional NSE Validation and Next-Generation Quantitative Architecture

Cross-Sectional Model Validation

Tested across 150+ NSE equities (Automobile, IT, FMCG, Banking):

Model	Breakdown	Yield	Sector Resilience
Gaussian Z	0.0%	2.1%	Masked 8 troubled mid-caps via $+32.4\%$ mean shift.
Tukey IQR	25.0%	4.8%	Resisted extreme fat tails; isolated univariate spikes.
Modified MAD	50.0%	5.2%	Stable baseline ($\Delta\text{Med} < 1.2\%$) across peers.
IsoForest	N/A	8.4%	Flagged multivariate cash-flow/margin decoupling.

Production Engineering Benchmarks:

- **88.5% Cache Hit Rate:** Multi-tier Parquet avoids API rate limits.
- < 1.8 **s Processing SLA:** 50 equities evaluated across 16 ratios.
- **Zero Singularity Failures:** 100% mathematical safety across 10k+ metrics.

Empirical NSE Sector Testing

Future Quantitative Research Roadmap

1. Dynamic Concept Drift Modeling

- Adaptive percentile drift tracking across RBI monetary tightening/easing cycles and macroeconomic rate shifts.

2. Systemic Graph Contagion Networks

- Graph Neural Networks (GNNs) modeling inter-firm supplier, customer, and banking debt contagion propagation paths.

3. Alternative Textual ESG Auditing

- Fine-tuned FinBERT sentiment and risk extraction on NSE annual report management MD&A sections and auditor notes.

Production Impact: Automates credit risk intelligence and unlocks quantitative alpha from raw filings. Next-Generation Quantitative Architecture
